1700 West First St.
Warden, WA 98857

Pumpkin Peppers is a series of pumpkin-shaped, sweet peppers. Spooky Red F1 is a fun and unique pepper plant producing bright red fruit at maturity. The immature fruit is a light green color maturing to a deep red. It presents its first ripened fruits centrally but will build a large branching plant during the fall season. This variety would make a great pot plant for late-season markets, just in time for Halloween!

HIGHLIGHTS

- 5-7" pot size
- Regrowth after first harvest
- Sweet, pumpkin-shaped fruit

CULTURAL SHEET

Properties

Variety number	375-010
Variety name	Spooky Red
Series name	Pumpkin Peppers
Species	Capsicum annuum
Common name	(Patio/Container) Pepper
Family	Solanum
Type	Annual
Seed weight	5.0-7.0 gram / 1000 sds depending on seed lot and variety
Days to maturity from transplant	85-100 days
Plant height	20-25"
Pruning/trimming	No
Fruit Weight	25-50 gr/fruit depending on culture
Use	<ul style="list-style-type: none"> • Balcony/container pepper for outdoor use with continuous harvest • Sweet snacking peppers

YOUNG PLANT CULTURE

number of seeds/plug

1 for plug size 0.5-1.2 inch

germination days

4-6 days* (biological disinfected seeds can take 2 days more)

germination temp.

73°-77°F (23°-25°C) Covered and high humidity, no light needed

growing days

21-28 days

growing temp.

70°-73°F (21°-23°C)

minimum growing temp.

65°F (18°C) This lengthens the growing days period

maximum growing temp.

95°F (35°C) This shortens the growing days period, encourage stretching internodes

optimal day/night temp.

day: 73°F (23°C)
night: 70°F (21°C)

soil for sowing

Sowing soil with good drainage, EC 1.5, PH 5.8-6.5

sowing covering

Vermiculite / soil with open structure /app. 2-3 mm thick

fertilization (f) in the plug

2.5 EC with each watering, NPK 15-10-15 and micro elements

ready to transplant

Full rooted plug with short internodes. Small young flower could be visible.

CULTIVATION TIPS DURING YOUNG PLANT GROWING

- Reduce the humidity soon after 70% germination. This prevents stretching of the hypocotyl. For pot peppers stretching is not desired.

FINISH PLANT CULTURE

potting soil

Standard soil with good drainage and water storage capabilities EC 2.5 PH 5.8-6.5

pot size

5-6" optimal 7"

plugs per pot

1 plug for pots.

indoor

Final distance indoor depends on pot size 10" x 10" (16 plts/m2)

spacing indoor

Space the plants when the leaves are reaching each other

outdoor in containers

Planting distance 3 plants in a 10-12" container

planting soil outdoor

Standard soil with good drainage and water storage capabilities EC 1.5, PH 5.8-6.5

minimum growing temp.

61°F (16°C) This lengthens the growing days period

ideal growing temp.

70°-77°F (21°C-25°C)

optimal day/night temp.

day: 77°F (23°C)
night: 64°F (18°C)

frost

Plants cannot stand frost

watering

Regularly for continues growth, keep the soil moist

Watering with minimal. 2.5 EC keeps peppers healthy

crop time to saleable product

12-14 weeks after planting, the first pepper turns from light green to red

CULTIVATION TIPS DURING FINISH PLANT GROWING

- Long days (>16 hrs) under relative high light densities increase the plant turning in a generative stage
- Plants are bred for high density crops with low maintenance. They produce their first set of fruits around the main stem above the first split.
- Put 2 sticks around the central stem of the plant to keep the plant in balance when fruits are growing.
- Temperatures below 5°C 40°F severely affect the growing.
- Insects, especially bees and bumble bees, support fruit set. Better pollination results in bigger fruits
- Pepper plants have a medium fertilization need. When the EC is too low, the leaves can turn yellow when the fruits are coloring. This also reduces the taste of the fruit.
- Pepper plants/leaves can be made sturdier by spraying (MgSO₄ -bitter salt and Dipotassium-sulphite (K₂SO₃)) solutions on the plants (possible combined with other chemicals which need to be used). This has a positive effect on the leaf size and color
- Clay in the soil will stabilize fertilization variation and reduce stretching. 2-5% is advisable, can be increased to 10%.
- Continuous growth, even in cool Summers
- The plant will not grow much taller when fruits are coloring. New fruits show up near the leaves continuously.
